ABSTRACT

Collapsible and portable cot type bed for pets and children. A spring biased horizontal connector pin can slidably attach bottom edges of vertical support legs to horizontal cross braces to maintain the cot in an assembled position that can support extreme amounts of weight. The horizontal pin can be connected to a bottom portion of a metal strip having an upper edge attached by rivets, solder or welding to the vertical support legs. Side wall panels along the planar support surface of the cot allow for keeping objects from sliding off the cot. A removable canopy for deflecting sun and providing shade when the cot is used outdoors can be mounted to the vertical legs above the planar support surface. The cot can be easily folded like an accordion and placed in a carrying bag and have a weight of less than approximately 15 pounds
